

Tablecube

Adrian Busse, Nico Seng, Thomas Schmidt, Lukas Vogrinc

With Tablecube, we would like to offer a table management system, with which restaurant visitors can perform all typical actions themselves from the table via their smartphone or the Tablecube located at the table. This includes the complete restaurant visit. From the reservation, the ordering of dishes to the payment. This guarantees the least possible contact with employees, while at the same time allowing diners to eat away from home. Something that is difficult to achieve in the current pandemic situation. Additionally, we also offer a restaurant owner and employee view of the app. Here, an owner can configure the information as well as employees through the app. Employees can see the respective orders and table statuses via the app.

Welcome Screen

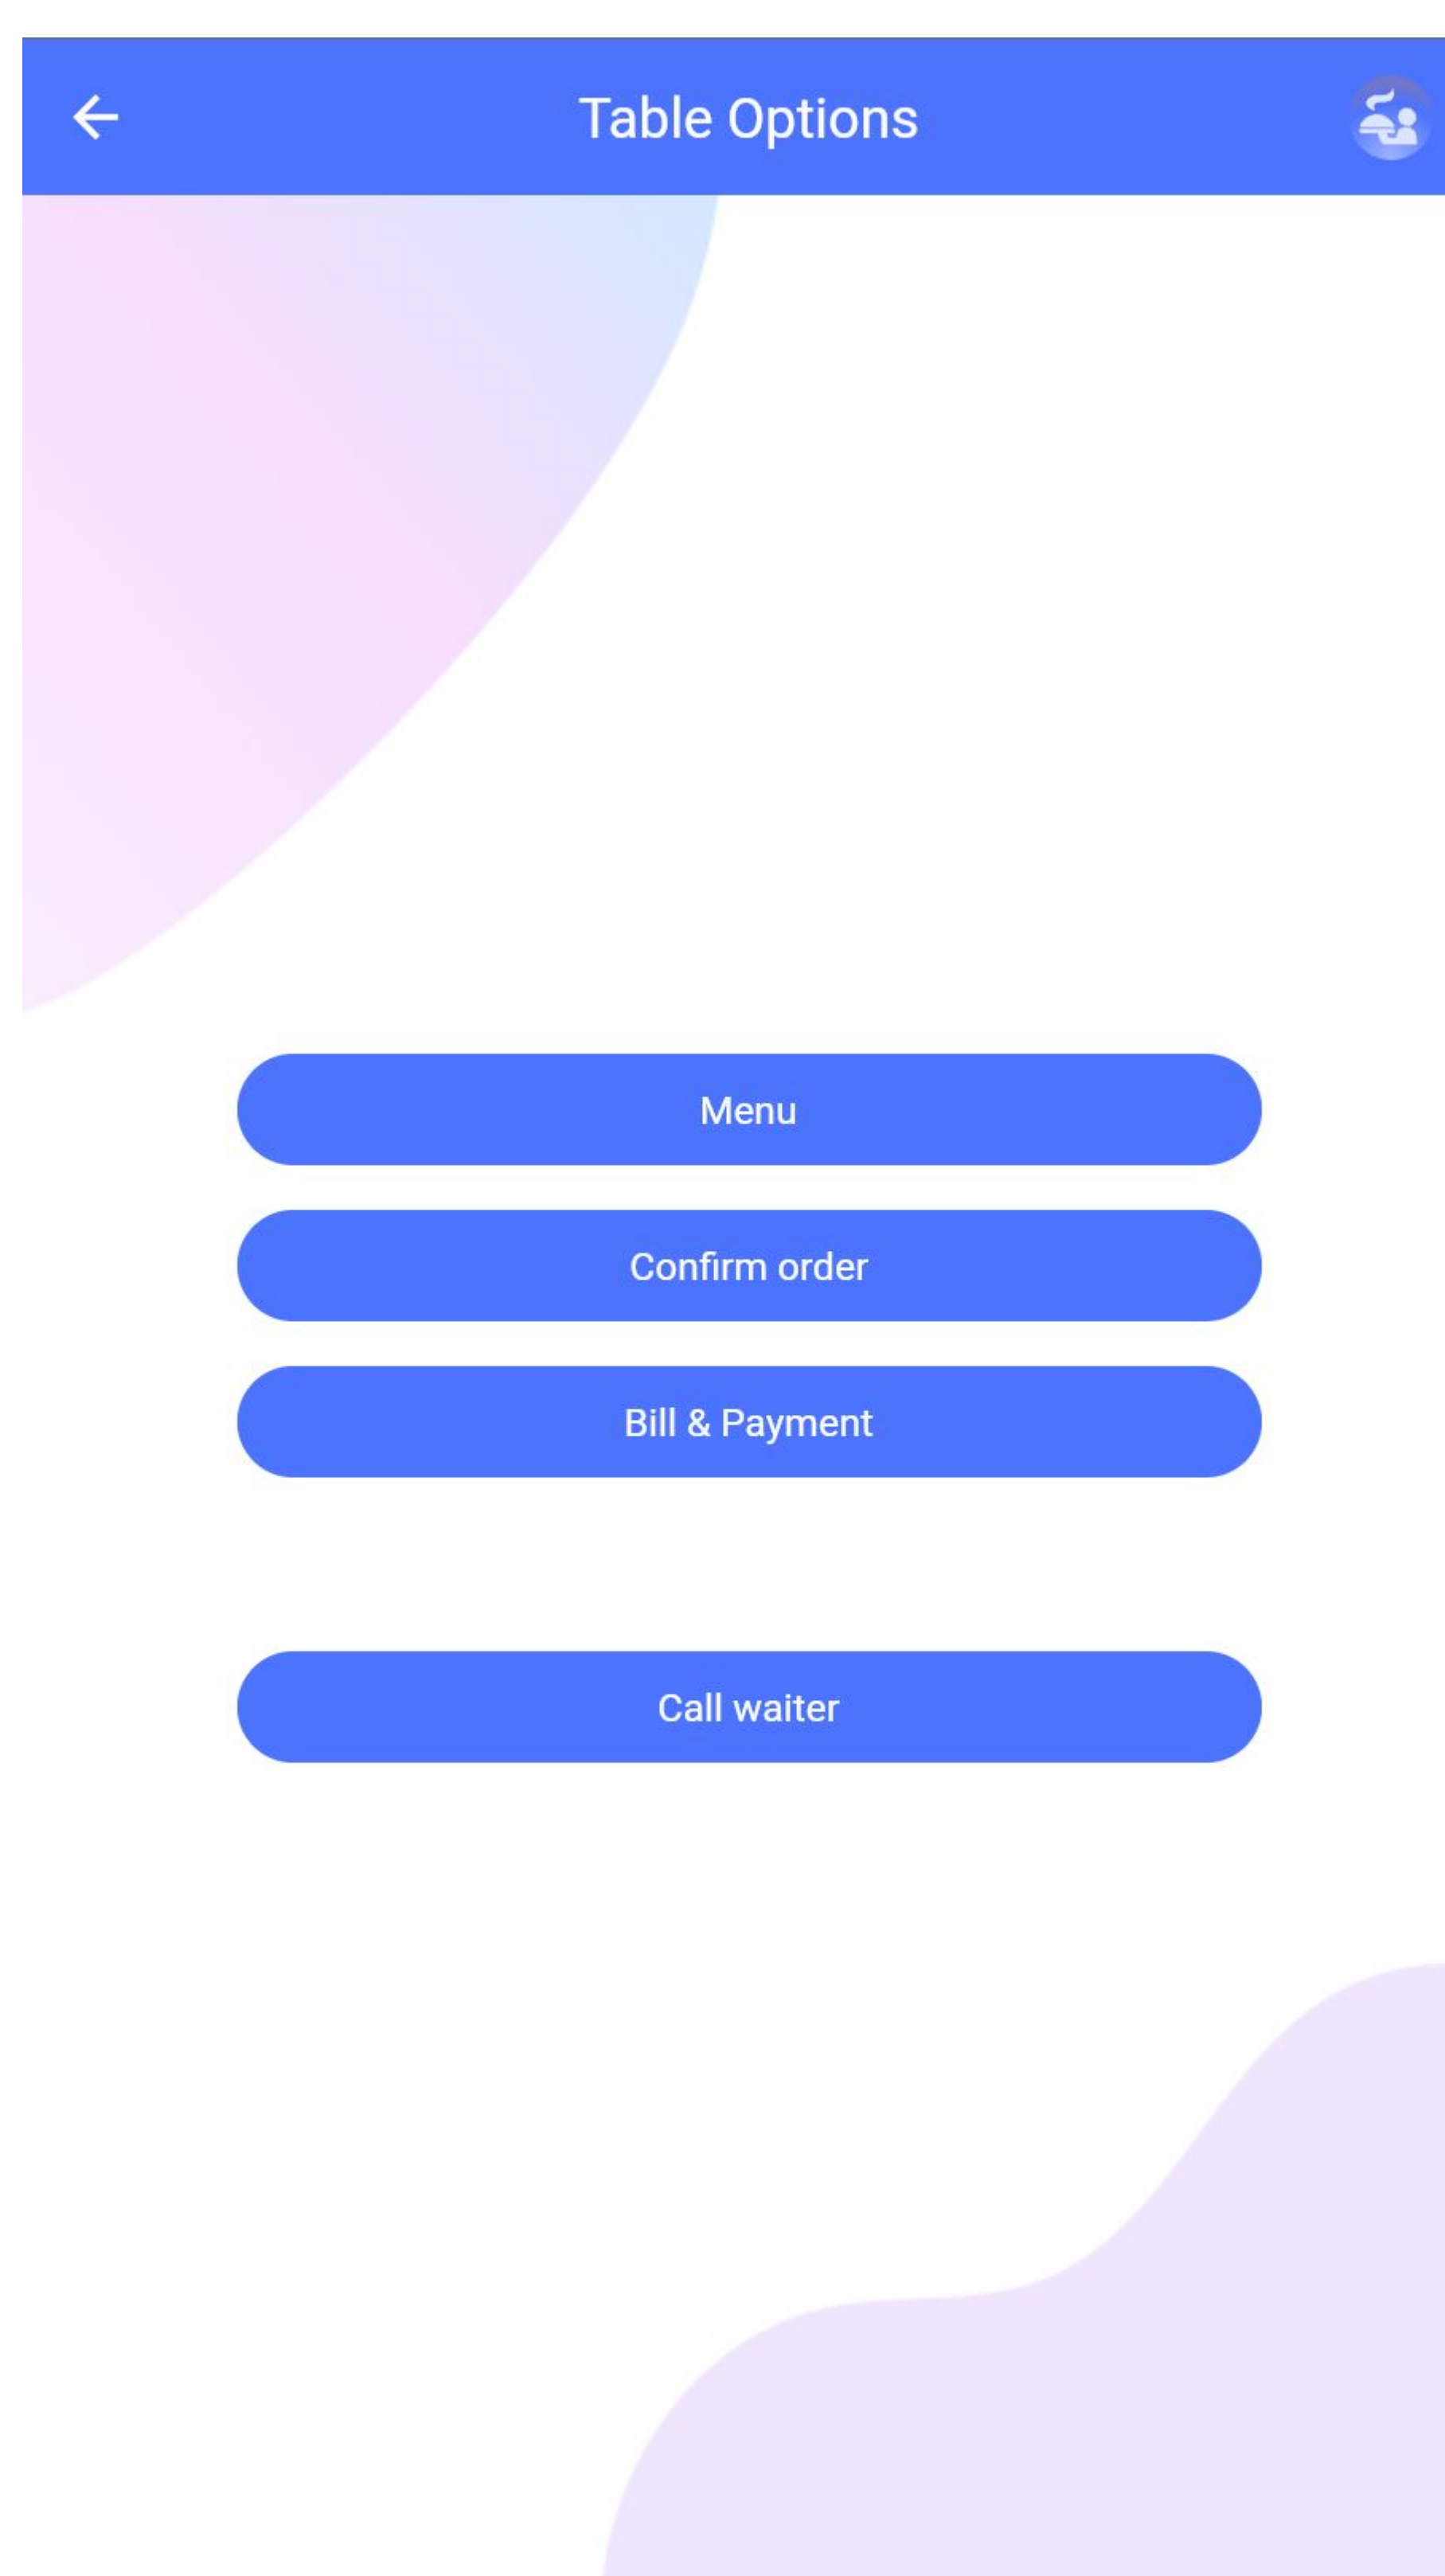

At the beginning, the user selects his desired restaurant from a list. He is then prompted to scan the table's QR code. The user is then required to enter the color code of the Tablecube in the app. If this is correct, the user can now log in to the app or create an account. In both cases, this leads to a complete overview of all functions for the user.

QR code on table

These include "Menu", "Confrim order", "Bill & Payment" and an option to call a waiter with "Call waiter".

Under "Menu" all dishes offered by the restaurant are listed. By touching the respective dish, it is added to the "Confrim order" view.

Overview Screen

Here the user sees all the dishes he ordered and can send them to the kitchen.

In the "Bill & Payment" view, a total overview of all ordered dishes is displayed, and the user can finish the process with his desired payment method

Pay view

This process can be handled both with the smartphone app and by pressing the according buttons on the Tablecube.
